Cellular Localization

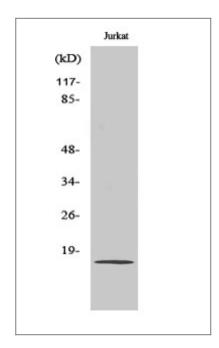

Secreted. Released by platelets upon wounding.

Tissue specificity PCR rescued clones,

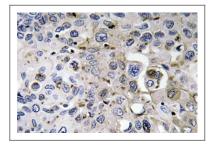

Function

Domain: The long form contains a basic insert which acts as a cell retention signal., Function: Platelet-derived growth factor is a potent mitogen for cells of mesenchymal origin. Binding of this growth factor to its affinity receptor elicits a variety of cellular responses. It is released by platelets upon wounding and plays an important role in stimulating adjacent cells to grow and thereby heals the wound., miscellaneous: A-A and B-B, as well as A-B, dimers can bind to the PDGF receptor., similarity: Belongs to the PDGF/VEGF growth factor family., subunit: Antiparallel disulfide-linked dimer of non-identical (A and B) chains. Homodimers of A and B chains are implicated in transformation processes. Interacts with CSPG4.,

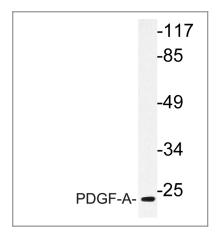

I Validation Data
